Lecture 8: Popular Variants of Evolutionary Algorithms

Chao Qian (钱超)

Associate Professor, Nanjing University, China

Email: qianc@nju.edu.cn Homepage: http://www.lamda.nju.edu.cn/qianc/

Evolutionary algorithms

There have been many popular variants of EAs

Genetic algorithms

Genetic Algorithms (GA)

Typically applied to optimization in discrete domains

[J. H. Holland. *Outline for a logical theory of adaptive systems*. JACM, 1962]

J. H. Holland 1929-2015 University of Michigan

Simple GA (SGA)

Representation	Binary representation
Recombination	One-point crossover
Mutation	Bit-wise mutation
Parent selection	Fitness proportional selection – implemented by Roulette Wheel
Survivor selection	Generational, i.e, age-based replacement with $\lambda = \mu$

Genetic algorithms

Genetic algorithms

Ensemble learning [Zhou, 2012]

• better performance than a single learner

Selective ensemble (ensemble pruning) [Zhou, 2012]

- better performance than the complete ensemble
- reduce storage and improve efficiency

Two goals

- maximize the generalization performance
- minimize the number of selected learners

PEP [Qian, Yu and Zhou, AAAI'15]: apply GA with uniform parent selection, bit-wise mutation and fitness-based survivor selection to solve the selective ensemble problem

- $x_i = 1$: the *i*-th base learner is selected
- $x_i = 0$: the *i*-th base learner is not selected

Pruning bagging base learners with size 100

Evolutionary Strategies (ES)

Typically applied to optimization in continuous domains

[I. Rechenberg. Cybernetic solution path of an experimental problem. 1965]

I. Rechenberg 1934-2021 Technic

Technical University of Berlin

Representation	Real-valued representation
Recombination	Discrete or arithmetic
Mutation	Gaussian perturbation
Parent selection	Uniform random
Survivor selection	Fitness-based replacement by (μ, λ) or $(\mu + \lambda)$
Speciality	Self-adaptation of mutation step sizes

Local recombination:

Select two parents uniformly at random

$$(x_1, \dots, x_n, \sigma_1, \dots, \sigma_n, \alpha_1, \dots, \alpha_{n(n-1)/2})$$

$$(y_1, \dots, y_n, \sigma'_1, \dots, \sigma'_n, \alpha'_1, \dots, \alpha'_{n(n-1)/2})$$

$$(z_1, \dots, z_n, \sigma''_1, \dots, \sigma''_n, \alpha''_1, \dots, \alpha''_{n(n-1)/2})$$

Discrete: z_i is chosen from x_i and y_i uniformly at random

Arithmetic: $\sigma_i^{\prime\prime} = \sigma_i/2 + \sigma_i^{\prime}/2$ $\alpha_i^{\prime\prime} = \alpha_i/2 + \alpha_i^{\prime}/2$

Global recombination: the two parents are selected uniformly at random for each position

Local recombination:

 $(x_1, \ldots, x_n, \sigma_1, \ldots, \sigma_n, \alpha_1, \ldots, \alpha_{n(n-1)/2})$ Select two parents $(y_1, \dots, y_n, \sigma'_1, \dots, \sigma'_n, \alpha'_1, \dots, \alpha'_{n(n-1)/2})$ uniformly at random $(z_1, \dots, z_n, \sigma_1'', \dots, \sigma_n'', \alpha_1'', \dots, \alpha_{n(n-1)/2}'')$ Correlated mutation: $(w_1, \dots, w_n, \delta_1, \dots, \delta_n, \beta_1, \dots, \beta_{n(n-1)/2})$ **Self-adaptation** $\delta_i = \sigma_i^{\prime\prime} \cdot e^{\tau' \cdot N(0,1) + \tau \cdot N_i(0,1)}$ $\beta_i = \alpha_i^{\prime\prime} + \beta \cdot N_i(0,1)$ w = z + N(0, C')

Reinforcement learning

• learn how to take actions in an environment in order to maximize the cumulative reward

Example: double pole with velocities problem

Goal: Learn an optimal policy to keep the angles of the poles in the range $[-36^{\circ}, 36^{\circ}]$ for 10^{5} time steps, where each step corresponds to 0.02s

velocity

State: vector
$$(x, \dot{x}, \theta_1, \dot{\theta_1}, \theta_2, \dot{\theta_2})$$

Action: exert forces either left or right on the cart

Reward: -1 when balancing fails (any of the poles out of range $[-36^{\circ}, 36^{\circ}]$)

Finite length track

[Igel, CEC'03] uses **CMA-ES** with average arithmetic recombination, Gaussian perturbation with self-adaptation, and $(\mu + \lambda)$ survivor selection to solve the double pole with velocities problem

C 11

CMA-ES	$n_{ m hidden}$	bias	$n_{ m weights}$	evaluations	failures

. .

5 1 100

CMA-ES can find an optimal policy even with a small population size

> CMA-ES is almost four times faster than the best previous algorithm

Evolutionary programming

Evolutionary Programming (EP)

Originally for optimizing finite state machines (agents)

L. J. Fogel 1928-2007

[L. J. Fogel, A. J. Owens, M. J. Walsh. Artificial Intelligence through Simulated Evolution. 1966]University of California, Los Angeles

Now typically applied to optimization in continuous domains, and almost merged with ES

Representation	Real-valued representation	diffe	rence
Recombination	None		-
Mutation	Gaussian perturbation		
Parent selection	Deterministic (each parent generates one offspring)		-
Survivor selection	Round-robin tournament]
Speciality	Self-adaptation of mutation step sizes		

Genetic Programming (GP)

Typically for optimizing computer programs

J. R. Koza 1944[J. R. Koza. Genetic Programming.1992]

Stanford University

Arithmetic formula:

2 .π⊥	$\left(\left(x+2\right) \right) =$	Y	2
$2 \cdot n +$	(x + 3) =	$\overline{5+1}$	

Representation	Tree representation
Recombination	Exchange of subtrees
Mutation	Random change in trees
Parent selection	Fitness proportional
Survivor selection	Generational replacement

π

Х

3

У

5

- Initial tree construction (maximum initial depth d_{max})
 - Full method (each branch has depth = d_{max}):
 - nodes at depth $< d_{max}$ are randomly chosen from *F*
 - nodes at depth d_{max} are randomly chosen from T
 - → Grow method (each branch has depth $\leq d_{max}$):
 - nodes at depth < d_{max} are randomly chosen from $F \cup T$
 - nodes at depth d_{max} are randomly chosen from T

- Bloat: average tree sizes tend to grow over time
 - Prohibiting variation operators that would generate "too big" offspring
 - Parsimony pressure: penalty for being oversized
- Parent selection

Selection pressure increases with the population size

- > Typically fitness proportional selection
- Over-selection for very large population sizes
 - rank population by fitness and divide it into two groups: group 1: best x% of population, group 2: other (100 x)%
 - 80% of selection chooses from group 1, 20% from group 2
 - for pop. size = 1000, 2000, 4000, 8000, x = 32, 16, 8, 4

Task: learn a rule to distinguish good from bad loan applicants

ID	No of children	Salary	Marital status	Good?
ID-1	2	45000	Married	0
ID-2	0	30000	Single	1
ID-3	1	40000	Divorced	1
•••				

Task: find a function f(x) to fit the observed data

 $(x_1, y_1), (x_2, y_2), \dots, (x_n, y_n)$

Fitness: the error

$$\sum_{i=1}^n (f(x_i) - y_i)^2$$

Task: antenna design in NASA's Space Technology 5 (ST5) mission

Quadrifilar helical antenna designed by human experts

Two antennas centered on the top and bottom of each spacecraft

Computer-Automated Evolution of an X-Band Antenna for NASA's Space Technology 5 Mission

Gregory. S. Hornby Gregory.S.Hornby@nasa.gov Mail Stop 269-3, University Affiliated Research Center, UC Santa Cruz, Moffett Field, CA, 94035, USA

Jason D. Lohn Jason.Lohn@west.cmu.edu Carnegie Mellon University, Mail Stop 23-11, Moffett Field, CA 94035, USA

Derek S. Linden dlinden@jemengineering.com JEM Engineering, 8683 Cherry Lane, Laurel, MD 20707, USA Moffett Field, CA 94035, USA

tree representation

use **GP** to design antenna automatically

Fitness: efficiency and gain evaluated by simulation

Re-evolved antenna ST5-33.142.7

Re-evolved antenna ST5-33.142.7

February 25, 2005

Delivered to Goddard Space Flight Center to undergo tests

April 8, 2005 Complete the tests

March 22, 2006

Launched from Vandenberg Air Force Base, California on a Pegasus XL rocket

Three ST5 spacecraft with the black radomes on top containing an evolved antenna, ST5-33.142.7

Three ST5 spacecraft mounted for launch on a Pegasus XL rocket

The first computer-evolved hardware in space

[J. R. Koza, et al. What's AI Done for Me Lately? Genetic Programming's Human-Competitive Results. IEEE Intelligent Systems, 18(3): 25-31, 2003.]

able 1. Human-competitive results produced by deficit programming.
--

Cia	imed instance	criteria number)
1.	Creating a better-than-classical quantum algorithm for the Deutsch-Jozsa "early promise" problem ²	2, 5
2.	Creating a better-than-classical quantum algorithm for Grover's database search problem ³	2, 5
3.	Creating a quantum algorithm for the depth-two AND/OR query problem that is better than any previously published result ^{4,5}	4
4.	Creating a quantum algorithm for the depth-one OR query problem that is better than any previously published result ⁵	4
5.	Creating a protocol for communicating information through a quantum gate that was previously thought not to permit such communication	ion ⁶ 4
6.	Creating a novel variant of quantum dense coding ⁶	4
7.	Creating soccer-playing program that ranked in the middle of the field of 34 human-written programs in the Robo Cup 1998 competi	ion ⁷ 8
8.	Creating four different algorithms for the transmembrane segment identification problem for proteins ^{8,9}	2, 5
9.	Creating a sorting network for seven items using only 16 steps ⁹	1, 4
10.	Rediscovering the Campbell ladder topology for lowpass and highpass filters ⁹	1,6
11.	Rediscovering the Zobel "M-derived half section" and "constant K" filter sections9	1,6
12.	Rediscovering the Cauer (elliptic) topology for filters ⁹	1, 6
13.	Automatic decomposition of the problem of synthesizing a crossover filter ⁹	1, 6
14.	Rediscovering a recognizable voltage gain stage and a Darlington emitter-follower section of an amplifier and other circuits ⁹	1,6
15.	Synthesizing 60 and 96 decibel amplifiers ⁹	1, 6
16.	Synthesizing analog computational circuits for squaring, cubing, square root, cube root, logarithm, and Gaussian functions ⁹	1, 4, 7
17.	Synthesizing a real-time analog circuit for time-optimal control of a robot ⁹	7
18.	Synthesizing an electronic thermometer ⁹	1, 7
19.	Synthesizing a voltage reference circuit ⁹	1, 7
20.	Creating a cellular automata rule for the majority classification problem that is better than the Gacs-Kurdyumov-Levin (GKL) rule and all other known rules written by humans ⁹	4, 5
21.	Creating motifs that detect the D–E–A–D box family of proteins and the manganese superoxide dismutase family ⁹	3
22.	Synthesizing topology for a PID-D2 (proportional, integrative, derivative, and second derivative) controller ¹⁰	1,6
23.	Synthesizing topology for a PID (proportional, integrative, and derivative) controller ¹⁰	1,6
24.	Synthesizing analog circuit equivalent to Philbrick circuit ¹⁰	1,6
25.	Synthesizing NAND circuit ¹⁰	1,6
26.	Simultaneously synthesizing topology, sizing, placement, and routing of analog electrical circuits ¹⁰	7
27.	Rediscovering Yagi-Uda antenna ¹⁰	2, 6, 7
28.	Creating PID tuning rules that outperform a PID controller using the Ziegler-Nichols and Astrom-Hagglund tuning rules ¹⁰	1, 2, 4, 5, 6, 7
29.	Creating three non-PID controllers that outperform PID controllers using the Ziegler-Nichols and Astrom-Hagglund tuning rules ¹⁰	1, 2, 4, 5, 6, 7
30.	Rediscovering negative feedback ¹⁰	1, 6
31.	Synthesizing a low-voltage balun circuit ¹⁰	1
32.	Synthesizing a mixed analog-digital variable capacitor circuit ¹⁰	1
33.	Synthesizing a high-current load circuit ¹⁰	1
34.	Synthesizing a voltage-current conversion circuit ¹⁰	1
35.	Synthesizing a cubic signal generator ¹⁰	1
36.	Synthesizing a tunable integrated active filter ¹⁰	1

e.g.: design low-voltage balun circuit

"The best-of-run evolved circuit (see Figure 1) is roughly a <u>fourfold improvement</u> over the <u>patented circuit in terms of our fitness measure.</u> The evolved circuit is superior both in terms of its frequency response and harmonic distortion."

Differential evolution

Differential Evolution (DE)

Typically applied to nonlinear and nondifferentiable continuous optimization

R. Storn

[R. Storn, K. Price. *Differential Evolution – A Simple and Efficient Adaptive Scheme for Global Optimization over Continuous Spaces*. 1995]

International Computer Science Institute in Berkeley, USA

Representation	Real-valued representation
Recombination	Uniform crossover
Mutation	Differential mutation
Parent selection	Uniform random selection
Survivor selection	Deterministic elitist replacement (parent vs. offspring)

Differential evolution

Differential evolution

Particle swarm optimization

J. Kennedy R. Eberhart

fish school

bird flock

Representation	Real-valued representation
Recombination	None
Mutation	Adding velocity vector
Parent selection	Deterministic (each parent creates one offspring via mutation)
Survivor selection	Generational (offspring replaces parents)

Particle Swarm Optimization (PSO)

[J. Kennedy, R. Eberhart. Particle Swarm Optimization. 1995]

Typically applied to nonlinear optimization

Particle swarm optimization

Particle swarm optimization

The *i*-th member in the population (a list):

 (x_i, v_i, y_i) solution, perturbation vector, named position named velocity the population particle Mutation $\begin{cases} \boldsymbol{v}'_i = \boldsymbol{w} \cdot \boldsymbol{v}_i + \phi_1 \mathbf{U}_1 \cdot (\boldsymbol{y}_i - \boldsymbol{x}_i) + \phi_2 \mathbf{U}_2 \cdot (\boldsymbol{z} - \boldsymbol{x}_i) \\ \boldsymbol{x}'_i = \boldsymbol{x}_i + \boldsymbol{v}'_i \end{cases}$ The global best \mathbf{z} is updated $\mathbf{y}'_i = \begin{cases} \mathbf{x}'_i & \text{if } f(\mathbf{x}'_i) < f(\mathbf{y}_i) \\ \mathbf{y}_i & \text{Otherwise} \end{cases}$ if min{ $f(x'_1), ..., f(x'_{\mu})$ } < f(z)

Ant colony optimization

Ant Colony Optimization (ACO)

Typically applied to find good paths through graphs

[M. Dorigo. Optimization, Learning and Natural Algorithms. 1992]

M. Dorigo

Ants find the shortest path between their nest and a good source using **pheromone trails**

Solution representation | path on a graph

Solution construction

An ant moves on the graph according to the pheromone and length of each edge

Pheromone update

The pheromone of each edge is updated according to the number of ants traversing it and the lengths of constructed paths

Ant colony optimization

Solution construction

An ant moves on the graph according to the pheromone and length of each edge

For an ant *k*, if the current vertex is *i*, the probability of selecting *j* as the next vertex is

$$p_{k}(i,j) = \begin{cases} (\tau(i,j)^{\alpha} (\eta(i,j))^{\beta} \\ \overline{\sum_{u \in J_{k}(i)} (\tau(i,u))^{\alpha} (\eta(i,u))^{\beta}}, & \text{if } j \in J_{k}(i) \\ 0, & \text{otherwise} \\ 0, & \text{otherwise} \\ \text{usually } 1/d(i,j), \text{ where } d(i,j) \\ \text{is the distance between } i \text{ and } j \end{cases}$$

Ant colony optimization

Pheromone update

The pheromone of each edge is updated according to the number of ants traversing it and the lengths of constructed paths

After the ants construct the paths, the pheromone is updated by

Estimation of distribution algorithms

Estimation of Distribution Algorithms (EDA) Applied to diverse optimization

[S. Baluja. Population-Based Incremental Learning: A Method for Integrating Genetic Search Based Function Optimization and Competitive Learning. 1994]

S. Baluja

Carnegie Mellon University

EDA guide the search for the optimum by building and sampling explicit probabilistic models of promising candidate solutions

Select the fittest subset of sampled solutions

Estimation of distribution algorithms

Summary

- Genetic algorithms
- Evolutionary strategies
- Evolutionary programming
- Genetic programming
- Differential evolution
- Particle swarm optimization
- Ant colony optimization
- Estimation of distribution algorithms
