tensor = multidimensional array

Application: Moment and Cumulant Tensors

Let **x** be a random vector of dimension n with components x_i . Its moment and cumulant tensors of order m as

$$\mathcal{M}(\mathbf{x}) = [\mu_{i_1, i_2, \cdots, i_m}] \quad \text{with} \quad \mu_{i_1, i_2, \cdots, i_m} = \mathbb{E}\{x_{i_1} x_{i_2} \cdots x_{i_m}\}$$

and

$$\mathcal{C}(\mathbf{x}) = [\mathbf{c}_{i_1,i_2,\cdots,i_m}] \quad \text{with} \quad \mathbf{c}_{i_1,i_2,\cdots,i_m} = \operatorname{Cum}\{x_{i_1}x_{i_2}\cdots x_{i_m}\}$$

Application: Adjacency and Laplacian Tensors

As a generalization of a graph, a uniform hypergraph G = (V, E)with $V = \{1, 2, \dots, n\}$ the vertex set and $E = \{e_1, e_2, \dots, e_m\}$ the edge set, is defined to satisfy that $|e_p| = k$ for any $e_p \subset V$, $p = 2, \dots, m$ and $k \ge 2$. Such a uniform hypergraph is also called a k-graph. If k = 2, G is exactly an ordinary graph.

Given a *k*-graph *G*, its adjacency tensor $\mathcal{A}(\mathcal{A}(G))$ of *G*, is a *k*-th order *n*-dimensional symmetric tensor, defined as $\mathcal{A} = [a_{i_1,i_2,\cdots,i_m}]$ where $a_{i_1,i_2,\cdots,i_m} = \frac{1}{(k-1)!}$ if $(i_1, i_2, \cdots, i_m) \in E$, and 0 otherwise.

For $i \in V$, its degree d(i) is defined as $d(i) = |\{e_i : i \in e_p \in E\}|$. The degree tensor \mathcal{D} of G is a k-th order n-dimensional tensor: $d_{i,i,\dots,i} = d(i)$. The Laplacian tensor is defined $\mathcal{D} - \mathcal{A}$.

Multiple Relations Tensor

Tensor can be used to describe the multiple relationships between objects. A tensor is a multidimensional array. Here a three-way array (third-order tensor) is used:

	O_1	<i>O</i> ₂	 On		O_1	<i>O</i> ₂	 On
O_1	a _{1,1,1}	a _{1,2,1}	 a _{1,n,1}	O_1	a _{1,1,2}	a _{1,2,2}	 a _{1,n,2}
<i>O</i> ₂	a _{2,1,1}	a _{2,2,1}	 a _{2,n,1}	O_2	a _{2,1,2}	a _{2,2,2}	 a 2,n,2
	:	:	 :	:	:	:	 :
On	a _{n,1,1}	a _{n,2,1}	 a _{n,n,1}	On	a _{n,1,2}	a _{n,2,2}	 a _{n,n,2}

	O_1	<i>O</i> ₂		On
O_1	a _{1,1,p}	a _{1,2,p}		a _{1,n,p}
 <i>O</i> ₂	a _{2,1,p}	a _{2,2,p}		a 2, <i>n</i> , <i>p</i>
		•		
:	:	:		:
On	a _{n,1,p}	a _{n,2,p}	• • •	a _{n,n,p}

p relationships among *n* objects

Application: Information Retrieval

- Web information retrieval is significantly more challenging than that based on web hyperlink structure
- One main difference is the multiple links based on the other features (text, images, etc)
- Example: 100,000 webpages from .GOV Web collection in 2002 TREC and 50 topic distillation topics in TREC 2003 Web track as queries
- Multiple links among webpages via different anchor texts
- ► 39,255 anchor terms (multiple relations), and 479,122 links with these anchor terms among the 100,000 webpages

Application: Networks

- In a social network where objects are connected via multiple relations, via sharing, comments, stories, photos, tags, keywords, topics, etc
- In a publication network where the interactions among items in three entities: author, keyword and paper

A tensor: the interactions among items in three dimensions/entities: author, keyword and paper; A matrix: the interactions between items in two dimensions/entities: concept and paper

Tensor Decomposition

CANDECOMP/PARAFAC Decomposition:

$$\mathcal{X} = \sum_{i=1}^r \lambda_i \mathbf{a}^{i,1} \otimes \cdots \otimes \mathbf{a}^{i,m}$$

The minimal value of r is called the rank of A.

Fig. 3.1 CP decomposition of a three-way array.

イロト 不得 トイヨト イヨト

Tensor Decomposition

Tucker Decomposition:

$$\mathcal{X} = \mathcal{G} \times \mathbf{A}_1 \times \mathbf{A}_2 \cdots \times \mathbf{A}_m$$
$$\mathcal{X} = \sum_{i_1=1}^{r_1} \cdots \sum_{i_m=1}^{r_m} g_{i_1, i_2, \cdots, i_m} \mathbf{a}^{i_1, 1} \otimes \cdots \otimes \mathbf{a}^{i_m, m}$$

It can be obtained by using singular value decomposition to each unfolded matrix \mathbf{X}_{i_j} from \mathcal{X} . The Tucker rank is $(rank(\mathbf{X}_1), rank(\mathbf{X}_2), \cdots, rank(\mathbf{X}_m)) = (r_1, r_2, \cdots, r_m)$.

- CP decomposition/rank cannot be computed efficiently
- Matrix rank can be replaced by matrix nuclear norm (the sum of singular values), it is a convex envelope
- Replace Tucker rank by the sum of nuclear norms of unfolding tensors, interdependent matrix trace norm is involved
- The use of the sum of nuclear norms of unfolding matrices of a tensor may be challenged since it is suboptimal¹
- ► The tensor trace norm (the average of trace norms of unfolding matrices) is not a tight convex relaxation of the tensor rank (the average rank of unfolding matrices)²

t-SVD

A third-order tensor of size $n_1 \times n_2 \times n_3$ can be viewed as an $n_1 \times n_2$ matrix of tubes which lie in the third-dimension. [Kilmer, M. E. and Martin, C. D. Linear Algebra & Its Applications, 435(3):641658, 2011]

Definition: The *t*-product $\mathcal{A} * \mathcal{B}$ of $\mathcal{A} \in \mathbb{R}^{n_1 \times n_2 \times n_3}$ and $\mathcal{B} \in \mathbb{R}^{n_2 \times n_4 \times n_3}$ is a tensor $\mathcal{C} \in \mathbb{R}^{n_1 \times n_4 \times n_3}$ whose (i, j)th tube is given by

$$\mathcal{C}(i,j,:) = \sum_{k=1}^{n_2} \mathcal{A}(i,k,:) * \mathcal{B}(k,j,:),$$

where \ast denotes the circular convolution between two tubes of same size.

The tube at (i, k) position in \mathcal{A} convolutes with the tube at (k, j) position in \mathcal{B} . Both have sizes n_3 . Put all the correlations at (i, j) position in \mathcal{C} .

The multiplication of between the scalars is replaced by circular convolution between the tubes.

Definition: The identity tensor $\mathcal{I} \in \mathbb{R}^{n \times n \times n_3}$ is defined to be a tensor whose first frontal slice $\mathcal{I}^{(1)}$ is the $n \times n$ identity matrix and whose other frontal slices $\mathcal{I}^{(i)}$, $i = 2, ..., n_3$ are zero matrices.

Definition: The conjugate transpose of a tensor $\mathcal{A} \in \mathbb{R}^{n_1 \times n_2 \times n_3}$ is the tensor $\mathcal{A}^H \in \mathbb{R}^{n_2 \times n_1 \times n_3}$ obtained by conjugate transposing each of the frontal slice and then reversing the order of transposed frontal slices 2 through n_3 , i.e.,

$$\begin{pmatrix} \mathcal{A}^{H} \end{pmatrix}^{(1)} = \left(\mathcal{A}^{(1)} \right)^{H},$$

$$\begin{pmatrix} \mathcal{A}^{H} \end{pmatrix}^{(i)} = \left(\mathcal{A}^{(n_{3}+2-i)} \right)^{H}, \quad i = 2, \dots, n_{3}.$$

Definition: A tensor $Q \in \mathbb{R}^{n \times n \times n_3}$ is orthogonal if it satisfies

$$\mathcal{Q}^{H} * \mathcal{Q} = \mathcal{Q} * \mathcal{Q}^{H} = \mathcal{I},$$

where \mathcal{I} is the identity tensor of size $n \times n \times n_3$.

Definition: A tensor A is called f-diagonal if each frontal slice $A^{(i)}$ is a diagonal matrix.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

For $\mathcal{A} \in \mathbb{R}^{n_1 \times n_2 \times n_3}$, the t-SVD of \mathcal{A} is given by

 $\mathcal{A} = \mathcal{U} * \mathcal{S} * \mathcal{V}^H,$

where $\mathcal{U} \in \mathbb{R}^{n_1 \times n_1 \times n_3}$ and $\mathcal{V} \in \mathbb{R}^{n_2 \times n_2 \times n_3}$ are orthogonal tensors, and $\mathcal{S} \in \mathbb{R}^{n_1 \times n_2 \times n_3}$ is a f-diagonal tensor, respectively. The entries in \mathcal{S} are called the singular tubes of \mathcal{A} .

The tensor tubal-rank, denoted as $rank_t(\mathcal{A})$, is defined as the number of nonzero singular tubes of \mathcal{S} , where \mathcal{S} comes from the t-SVD of \mathcal{A} , i.e.,

$$\mathsf{rank}_t(\mathcal{A}) = \#\{i: \mathcal{S}(i,i,:) \neq \vec{0}\}.$$

It can be shown that it is equal to $\max_i \operatorname{rank}(\hat{\mathcal{A}}^{(i)})$ where $\hat{\mathcal{A}}^{(i)}$ is the *i*-th slice of $\hat{\mathcal{A}}$ and $\hat{\mathcal{A}}$ represents a third-order tensor obtained by taking the Discrete Fourier Transform (DFT) of all the tubes along the third dimension of \mathcal{A} .

Can we recover low-tubal-rank tensor from partial and grossly corrupted observations exactly ?

Tensor Incoherence Conditions

Assume that $rank_t(\mathcal{L}_0) = r$ and its t-SVD $\mathcal{L}_0 = \mathcal{U} * \mathcal{S} * \mathcal{V}^H$. \mathcal{L}_0 is said to satisfy the tensor incoherence conditions with parameter $\mu > 0$ if

$$\max_{i=1,\cdots,n_1} \|\mathcal{U}^H * \vec{e_i}\|_F \le \sqrt{\frac{\mu r}{n_1}},$$
$$\max_{j=1,\cdots,n_2} \|\mathcal{V}^H * \vec{e_j}\|_F \le \sqrt{\frac{\mu r}{n_2}},$$

and (joint incoherence condition)

$$\|\mathcal{U}*\mathcal{V}^{H}\|_{\infty} \leq \sqrt{\frac{\mu r}{n_{1}n_{2}n_{3}}}$$

Tensor Incoherence Conditions

The **column basis**, denoted as \vec{e}_i , is a tensor of size $n_1 \times 1 \times n_3$ with its (i, 1, 1)th entry equaling to 1 and the rest equaling to 0. The **tube basis**, denoted as \mathring{e}_k , is a tensor of size $1 \times 1 \times n_3$ with its (1, 1, k)th entry equaling to 1 and the rest equaling to 0.

Low Rank Tensor Recovery

Theorem

Suppose $\mathcal{L}_0 \in \mathbb{R}^{n_1 \times n_2 \times n_3}$ obeys tensor incoherence conditions, and the observation set Ω is uniformly distributed among all sets of cardinality $m = \rho n_1 n_2 n_3$. Also suppose that each observed entry is independently corrupted with probability γ . Then, there exist universal constants $c_1, c_2 > 0$ such that with probability at least $1 - c_1(n_{(1)}n_3)^{-c_2}$, the recovery of \mathcal{L}_0 with $\lambda = 1/\sqrt{\rho n_{(1)}n_3}$ is exact, provided that

$$r \leq rac{c_r n_{(2)}}{\mu(\log(n_{(1)}n_3))^2} \quad ext{and} \quad \gamma \leq c_\gamma$$

where c_r and c_γ are two positive constants. $n_{(1)} = \max\{n_1, n_2\}$ and $n_{(2)} = \min\{n_1, n_2\}$

Low Rank Tensor Recovery

Theorem

(Tensor Completion): Suppose $\mathcal{L}_0 \in \mathbb{R}^{n_1 \times n_2 \times n_3}$ obeys tensor incoherence conditions, and m entries of \mathcal{L}_0 are observed with locations sampled uniformly at random, then there exist universal constants $c_0, c_1, c_2 > 0$ such that if

$$m \ge c_0 \mu rn_{(1)} n_3 (\log(n_{(1)} n_3))^2,$$

 \mathcal{L}_0 is the unique minimizer to the convex optimization problem with probability at east $1 - c_1(n_{(1)}n_3)^{-c_2}$.

Low Rank Tensor Recovery

Theorem

(Tensor Robust PCA): Suppose $\mathcal{L}_0 \in \mathbb{R}^{n_1 \times n_2 \times n_3}$ obeys tensor incoherence conditions and joint incoherence condition and \mathcal{E}_0 has support uniformly distributed with probability γ . Then, there exist universal constants $c_1, c_2 > 0$ such that with probability at least $1 - c_1(n_{(1)}n_3)^{-c_2}$, ($\mathcal{L}_0, \mathcal{E}_0$) is the unique minimizer to the convex optimization problem with $\lambda = 1/\sqrt{n_{(1)}n_3}$, provided that

$$r \leq rac{c_r n_{(2)}}{\mu(\log(n_{(1)} n_3))^2} \quad ext{and} \quad \gamma \leq c_\gamma$$

where c_r and c_γ are two positive constants.

Convex Optimization Problem

Input: \mathcal{X} , Ω and λ . Initialize: $\mathcal{L}^0 = \mathcal{E}^0 = \mathcal{Y}^0 = 0$, $\rho = 1.1$, $\mu^0 = 1e-4$, $\mu_{max} = 1e8$.

WHILE not converged

1. Update \mathcal{L}^{k+1} by

$$\min_{\mathcal{L}} \|\mathcal{L}\|_{\mathsf{TNN}} + \frac{\mu^{k}}{2} \|\mathcal{L} + \mathcal{E}^{k} - \mathcal{X} + \frac{\mathcal{Y}^{k}}{\mu^{k}} \|_{F}^{2};$$

2. Update $P_{\Omega}(\mathcal{E}^{k+1})$ by

$$\min_{\mathcal{E}} \lambda \| P_{\Omega}(\mathcal{E}) \|_{1} + \frac{\mu^{k}}{2} \| P_{\Omega} \Big(\mathcal{E} + \mathcal{L}^{k+1} - \mathcal{X} + \frac{\mathcal{Y}^{k}}{\mu^{k}} \Big) \Big\|_{F}^{2};$$

- 3. Update $P_{\Omega^c}(\mathcal{E}^{k+1})$ by $P_{\Omega^c}(\mathcal{E}^{k+1}) = P_{\Omega^c}(\mathcal{X} \mathcal{L}^{k+1} \mathcal{Y}^k/\mu^k);$
- 4. Update the multipliers \mathcal{Y}^{k+1} by $\mathcal{Y}^{k+1} = \mathcal{Y}^k + \mu^k (\mathcal{L}^{k+1} + \mathcal{E}^{k+1} - \mathcal{X});$
- 5. Update μ^{k+1} by $\mu^{k+1} = \min(\rho \mu^k, \mu_{\max});$
- 6. Check the convergence condition
- ENDWHILE

Output: \mathcal{L}

The Correction Model

The Corrected Model

Issue: The nuclear norm minimization of a matrix may be challenged under general sampling distribution. Salakhutdinov et al.³ showed that when certain rows and/or columns were sampled with high probability, the matrix nuclear norm minimization may fail in the sense that the number of observations required for recovery was much more than the setting of most matrix completion problems.

Miao et al. proposed a rank-corrected model for low-rank matrix recovery with fixed basis coefficients⁴.

 $^{^3\}mathsf{R}.$ Salakhutdinov and N. Srebro. Collaborative filtering in a non-uniform world: Learning with the weighted trace norm. In Adv. Neural Inform. Process. Syst., pages 20562064, 2010.

⁴W. Miao, S. Pan, and D. Sun. A rank-corrected procedure for matrix completion with fixed basis coefficients. Math. Program., 159(1):289338, 2016.

For any given index set $\Omega \subset \{1, 2, \ldots, n_1\} \times \{1, 2, \ldots, n_2\} \times \{1, 2, \ldots, n_3\}$, we define the sampling operator $\mathfrak{D}_{\Omega} : \mathbb{R}^{n_1 \times n_2 \times n_3} \to \mathbb{R}^{|\Omega|}$ by

$$\mathfrak{D}_{\Omega}(\mathcal{X}) = (\langle \mathcal{E}_{ijk}, \mathcal{X} \rangle)_{(i,j,k) \in \Omega}^{T},$$

where $|\Omega|$ denotes the number of entries in Ω .

Let $\mathcal{X}_0 \in \mathbb{R}^{n_1 \times n_2 \times n_3}$ be an unknown true tensor. The observed model can be described in the following form:

$$\mathbf{y} = \mathfrak{D}_{\Omega}(\mathcal{X}_0) + \sigma \varepsilon,$$

where $\mathbf{y} = (y_1, y_2, \dots, y_m)^T \in \mathbb{R}^m$ and $\varepsilon = (\varepsilon_1, \varepsilon_2, \dots, \varepsilon_m)^T \in \mathbb{R}^m$ are the observation vector and the noise vector, respectively, ε_i are the independent and identically distributed (i.i.d.) noises with $\mathbb{E}(\varepsilon_i) = 0$ and $\mathbb{E}(\varepsilon_i^2) = 1$, and $\sigma > 0$ controls the magnitude of noise.

Assumption: Each entry is sampled with positive probability, i.e., there exists a positive constant $\kappa_1\geq 1$ such that

$$p_{ijk}\geq \frac{1}{\kappa_1n_1n_2n_3}.$$

It implies

$$\mathbb{E}(\langle \mathcal{E}, \mathcal{X} \rangle^2) = \sum_{i=1}^{n_1} \sum_{j=1}^{n_2} \sum_{k=1}^{n_3} p_{ijk} x_{ijk}^2 \ge \frac{1}{\kappa_1 n_1 n_2 n_3} \|\mathcal{X}\|_F^2.$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへで

In the matrix case, the nuclear norm penalization may fail when some columns or rows are sampled with very high probability. In the third-order tensor, we also need to avoid this case that each fiber is sampled with very high probability. Let

$$R_{jk} = \sum_{i=1}^{n_1} p_{ijk}, \quad C_{ik} = \sum_{j=1}^{n_2} p_{ijk}, \quad T_{ij} = \sum_{k=1}^{n_3} p_{ijk},$$

Assumption: There exists a positive constant $\kappa_2 \ge 1$ such that

$$\max_{i,j,k} \{ R_{jk}, C_{ik}, T_{ij} \} \le \frac{\kappa_2}{\min\{n_1, n_2, n_3\}}$$

$$\min \frac{1}{2m} \|\mathbf{y} - \mathfrak{D}_{\Omega}(\mathcal{X})\|^{2} + \mu \Big(\|\mathcal{X}\|_{TNN} - \langle F(\mathcal{X}_{m}), \mathcal{X} \rangle \Big)$$

s.t. $\|\mathcal{X}\|_{\infty} \leq c,$

where the spectral function $F : \mathbb{R}^{n_1 \times n_2 \times n_3} \to \mathbb{R}^{n_1 \times n_2 \times n_3}$ is given as follows: $F(\mathcal{X}_m) := \mathcal{U} * \Sigma * \mathcal{V}^H$, associated with

$$\Sigma = \operatorname{ifft}(\widehat{\mathcal{M}}, [], 3) \text{ with } \widehat{\mathcal{M}}^{(i)} = f(\widehat{S}^{(i)}) := \operatorname{Diag}\left(f\left(\operatorname{diag}(\widehat{S}^{(i)})\right)\right),$$

f is defined by

$$f_i(\mathbf{x}) := \left\{ egin{array}{l} \phi\left(rac{x_i}{\|\mathbf{x}\|_\infty}
ight), & ext{if } \mathbf{x}
eq 0, \ 0, & ext{otherwise}, \end{array}
ight.$$

and the scalar function $\phi : \mathbb{R} \to \mathbb{R}$, is defined by

$$\phi(z) = (1 + \varepsilon^{\tau}) \frac{|z|^{\tau}}{|z|^{\tau} + \varepsilon^{\tau}}.$$

- ► The correction function *F* is used to get a lower tubal rank solution.
- For the small singular values of the frontal slices in the Fourier domain, we would like to penalize more in the correction procedure. Then these small singular values will approximate to zero in the next correction procedure. In this case, the model can generate a lower tubal rank solution by the correction method.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Theorem

Suppose the two assumptions hold. Let $\tau > 1$ be given. Then, for $m \ge \tilde{n}n_3 \log^3(n_1n_3 + n_2n_3)/\kappa_2$, there exists constants \tilde{C} , $C_1 > 0$ such that

$$\frac{\|\mathcal{X}_{c} - \mathcal{X}_{0}\|_{F}^{2}}{n_{1}n_{2}n_{3}} \leq \frac{n_{1}n_{2}\kappa_{1}^{2}\kappa_{2}\log((n_{1} + n_{2})n_{3})}{m\tilde{n}}$$
$$\left(32C_{1}^{2}\left(\frac{\sqrt{2r}}{\tau} + \alpha_{m}\right)^{2}\tau^{2}\sigma^{2} + 4096\tilde{C}c^{2}\left(\frac{\tau(\sqrt{2r} + \alpha_{m})}{\tau - 1}\right)^{2}\right)$$

with probability at least $1 - \frac{2}{n_1 + n_2 + n_3}$, where $\alpha_m = \|\widetilde{\mathcal{U}}_1 * \widetilde{\mathcal{V}}_1^T - F(\mathcal{X}_m)\|_F$. Here $\widetilde{\mathcal{U}}_1, \widetilde{\mathcal{V}}_1^T$ are the associated orthogonal tensors in t-SVD of \mathcal{X}_0 .

Let $\mathfrak{U}(\mathcal{X}) := \{\mathcal{X} | \|\mathcal{X}\|_{\infty} \leq c\}$. By introducing $\mathbf{z} = \mathbf{y} - \mathfrak{D}_{\Omega}(\mathcal{X})$ and $\mathcal{X} = S$, the model is given by

min
$$\frac{1}{2m} \|\mathbf{z}\|^2 + \mu \Big(\|\mathcal{X}\|_{TNN} - \langle F(\mathcal{X}_m), \mathcal{X} \rangle \Big) + \delta_{\mathfrak{U}}(\mathcal{S})$$

s.t.
$$\mathbf{z} = \mathbf{y} - \mathfrak{D}_{\Omega}(\mathcal{X}), \mathcal{X} = \mathcal{S}.$$

Since the TNN is the dual norm of the tensor spectral norm, its Lagrangian dual is given as follows:

$$\max_{\mathbf{u},\mathcal{W}} \quad -\frac{m}{2} \|\mathbf{u}\|^2 + \langle \mathbf{u}, \mathbf{y} \rangle - \delta_{\mathfrak{U}}^*(-\mathcal{W})$$

s.t. $\|\mu F(\mathcal{X}_m) + \mathfrak{D}_{\Omega}^*(\mathbf{u}) + \mathcal{W}\| \le \mu.$

Let
$$\mathcal{Z} := \mu F(\mathcal{X}_m) - \mathfrak{D}^*_{\Omega}(\mathbf{u}) + \mathcal{W} \text{ and } \mathfrak{X}(\mathcal{X}) := \{\mathcal{X} | \|\mathcal{X}\| \le \mu\}.$$

$$\min_{\mathbf{u}, \mathcal{W}, \mathcal{Z}} \quad \frac{m}{2} \|\mathbf{u}\|^2 - \langle \mathbf{u}, \mathbf{y} \rangle + \delta^*_{\mathfrak{U}}(-\mathcal{W}) + \delta_{\mathfrak{X}}(\mathcal{Z})$$
$$\text{s.t.} \qquad \mathcal{Z} = \mu F(\mathcal{X}_m) + \mathfrak{D}^*_{\Omega}(\mathbf{u}) + \mathcal{W}.$$

The augmented Lagrangian function is defined by

$$\begin{split} L(\mathbf{u},\mathcal{W},\mathcal{Z},\mathcal{X}) &:= \frac{m}{2} \|\mathbf{u}\|^2 - \langle \mathbf{u},\mathbf{y} \rangle + \delta^*_{\mathfrak{U}}(-\mathcal{W}) + \delta_{\mathfrak{X}}(\mathcal{Z}) \\ &- \langle \mathcal{X}, \mathcal{Z} - \mu F(\mathcal{X}_m) - \mathfrak{D}^*_{\Omega}(\mathbf{u}) - \mathcal{W} \rangle \\ &+ \frac{\beta}{2} \|\mathcal{Z} - \mu F(\mathcal{X}_m) - \mathfrak{D}^*_{\Omega}(\mathbf{u}) - \mathcal{W}\|_F^2, \end{split}$$

where $\beta > 0$ is the penalty parameter and \mathcal{X} is the Lagrangian multiplier.

The iteration system of sGS-ADMM is described as follows:

$$\mathbf{u}^{k+\frac{1}{2}} = \arg\min_{\mathbf{u}} \left\{ L(\mathbf{u}, \mathcal{W}^{k}, \mathcal{Z}^{k}, \mathcal{X}^{k}) \right\},\$$
$$\mathcal{W}^{k+1} = \arg\min_{\mathcal{W}} \left\{ L(\mathbf{u}^{k+\frac{1}{2}}, \mathcal{W}, \mathcal{Z}^{k}, \mathcal{X}^{k}) \right\},\$$
$$\mathbf{u}^{k+1} = \arg\min_{\mathbf{u}} \left\{ L(\mathbf{u}, \mathcal{W}^{k+1}, \mathcal{Z}^{k}, \mathcal{X}^{k}) \right\},\$$
$$\mathcal{Z}^{k+1} = \arg\min_{\mathcal{Z}} \left\{ L(\mathbf{u}^{k+1}, \mathcal{W}^{k+1}, \mathcal{Z}, \mathcal{X}^{k}) \right\},\$$
$$\mathcal{X}^{k+1} = \mathcal{X}^{k} - \gamma \beta \left(\mathcal{Z}^{k+1} - \mu F(\mathcal{X}_{m}) - \mathfrak{D}_{\Omega}^{*}(\mathbf{u}^{k+1}) - \mathcal{W}^{k+1} \right),\$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

where $\gamma \in (0, (1 + \sqrt{5})/2)$ is the step-length.

The optimal solution with respect to \mathbf{u} is given explicitly by

$$\mathbf{u} = \frac{1}{m+\beta} \Big(\mathbf{y} - \mathfrak{D}_{\Omega} \Big(\mathcal{X} + \beta (\mu F(\mathcal{X}_m) + \mathcal{W} - \mathcal{Z}) \Big) \Big).$$

The optimal solution with respect to $\ensuremath{\mathcal{W}}$ is given explicitly by

$$\mathcal{W}^{k+1} = -\operatorname{Prox}_{\frac{1}{\beta}\delta_{\mathfrak{U}}^{*}} \left(\frac{1}{\beta} \mathcal{X}^{k} + \mu F(\mathcal{X}_{m}) + \mathfrak{D}_{\Omega}^{*}(\mathbf{u}^{k+\frac{1}{2}}) - \mathcal{Z}^{k} \right)$$

$$= -\left(\frac{1}{\beta} \mathcal{X}^{k} + \mu F(\mathcal{X}_{m}) + \mathfrak{D}_{\Omega}^{*}(\mathbf{u}^{k+\frac{1}{2}}) - \mathcal{Z}^{k} \right)$$

$$+ \frac{1}{\beta} \operatorname{Prox}_{\beta\delta_{\mathfrak{U}}} \left(\beta \left(\frac{1}{\beta} \mathcal{X}^{k} + \mu F(\mathcal{X}_{m}) + \mathfrak{D}_{\Omega}^{*}(\mathbf{u}^{k+\frac{1}{2}}) - \mathcal{Z}^{k} \right) \right).$$

For the subproblem with respect to \mathcal{Z} , it is a projection onto \mathfrak{X} , which has a closed-form solution.

Theorem

For any $\mathcal{Y} \in \mathbb{R}^{n_1 \times n_2 \times n_3}$ and $\rho > 0$, let $\mathcal{Y} = \mathcal{U} * \mathcal{S} * \mathcal{V}^H$ be the t-SVD. Then the optimal solution \mathcal{X}^* of the following problem

$$\min_{\mathcal{X}\in\mathbb{R}^{n_1\times n_2\times n_3}} \{\|\mathcal{X}-\mathcal{Y}\|_F^2, \|\mathcal{X}\|\leq \rho\}$$

is given by

$$\mathcal{X}^* = \mathcal{U} * \mathcal{S}_{\rho} * \mathcal{V}^H,$$

where $S_{\rho} = ifft(min{\overline{S}, \rho}, [], 3).$

The optimal solution with respect to \mathcal{Z} in (1) is given by

$$\begin{aligned} \mathcal{Z}^{k+1} &= \mathsf{Prox}_{\frac{1}{\beta}\delta_{\mathfrak{X}}} \Big(\mu F(\mathcal{X}_m) + \mathfrak{D}^*_{\Omega}(\mathbf{u}^{k+1}) + \mathcal{W}^{k+1} + \frac{1}{\beta}\mathcal{X}^{k+1} \Big) \\ &= \mathcal{U}^{k+1} * \mathcal{S}^{k+1}_{\mu} * (\mathcal{V}^{k+1})^T, \end{aligned}$$

where $\mathcal{S}^{k+1}_{\mu} = \mathrm{ifft}(\min\{\overline{\mathcal{S}^{k+1}},\mu\},[\],3)$ and

$$\mu F(\mathcal{X}_m) - \mathfrak{D}^*_{\Omega}(\mathbf{u}^{k+1}) + \mathcal{W}^{k+1} + \frac{1}{\beta}\mathcal{X}^{k+1} = \mathcal{U}^{k+1} * \mathcal{S}^{k+1} * (\mathcal{V}^{k+1})^T.$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Theorem

The optimal solution set is nonempty and compact.

Only two blocks with respect to \mathcal{W}, \mathcal{Z} are nonsmooth and other blocks are quadratic.

Theorem

Suppose that $\beta > 0$ and $\gamma \in (0, (1 + \sqrt{5})/2)$. Let the sequence $\{(\mathcal{W}^k, \mathbf{u}^k, \mathcal{Z}^k, \mathcal{X}^k)\}$ be generated by the algorithm. Then $\{(\mathcal{W}^k, \mathbf{u}^k, \mathcal{Z}^k)\}$ converges to an optimal solution and $\{\mathcal{X}^k\}$ converges to an optimal solution of the dual problem.

Other t-SVDs

Revisit t-SVD

We use $\tilde{\mathcal{X}} \in \mathbb{C}^{m_1 \times m_2 \times m_3}$ to represent the discrete Fourier transform of $\mathcal{X} \in \mathbb{C}^{m_1 \times m_2 \times m_3}$ along each tube, i.e., $\tilde{\mathcal{X}} = \operatorname{fft}(\mathcal{X}, [], 3)$. The block circulant matrix is defined as

$$\mathsf{bcirc}(\mathcal{X}) := \begin{bmatrix} \mathbf{X}^{(1)} & \mathbf{X}^{(m_3)} & \dots & \mathbf{X}^{(2)} \\ \mathbf{X}^{(2)} & \mathbf{X}^{(1)} & \dots & \mathbf{X}^{(3)} \\ \vdots & \vdots & \ddots & \vdots \\ \mathbf{X}^{(m_3)} & \mathbf{X}^{(m_3-1)} & \dots & \mathbf{X}^{(1)} \end{bmatrix}$$

The block diagonal matrix and the corresponding inverse operator are defined as

$$\mathsf{bdiag}(\mathcal{X}) := \begin{bmatrix} \mathbf{X}^{(1)} & & \\ & \mathbf{X}^{(2)} & \\ & \ddots & \\ & & \mathbf{X}^{(m_3)} \end{bmatrix},$$
$$\mathsf{unbdiag}(\mathsf{bdiag}(\mathcal{X})) = \mathcal{X}.$$

Revisit t-SVD

Theorem

$$bdiag(\tilde{\mathcal{X}}) = (\mathbf{F}_{m_3} \otimes \mathbf{I}_{m_1})bcirc(\mathcal{X})(\mathbf{F}_{m_3}^H \otimes \mathbf{I}_{m_2}),$$

where \otimes denotes the Kronecker product, \mathbf{F}_{m_3} is an $m_3 \times m_3$ DFT matrix and \mathbf{I}_m is an $m \times m$ identity matrix.

Revisit t-SVD

The unfold and fold operators in t-SVD are defined as

$$\mathsf{unfold}(\mathcal{X}) := \begin{bmatrix} \mathbf{X}^{(1)} \\ \mathbf{X}^{(2)} \\ \vdots \\ \mathbf{X}^{(m_3)} \end{bmatrix}, \quad \mathsf{fold}(\mathsf{unfold}(\mathcal{X})) = \mathcal{X}.$$

Given $\mathcal{X} \in \mathbb{C}^{m_1 \times m_2 \times m_3}$ and $\mathcal{Y} \in \mathbb{C}^{m_2 \times m_4 \times m_3}$, the t-product $\mathcal{X} * \mathcal{Y}$ is a third-order tensor of size $m_1 \times m_4 \times m_3$

$$\mathcal{Z} = \mathcal{X} * \mathcal{Y} := \mathsf{fold}(\mathsf{bcirc}(\mathcal{X})\mathsf{unfold}(\mathcal{Y})).$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Since the corresponding block circulant matrices can be diagonalized by DFT, the DFT based t-SVD can be efficiently implemented via fast Fourier transform (fft).

The first work is given by E. Kernfeld, M. Kilmer and S. Aeron, Tensor tensor products with invertible linear transforms, LAA, Vol 485, pp. 545-570 (2015).

We define the shift of tensor
$$\mathcal{A} = \text{fold} \begin{bmatrix} \mathbf{A}^{(1)} \\ \mathbf{A}^{(2)} \\ \vdots \\ \mathbf{A}^{(m_3)} \end{bmatrix}$$
 as

$$\sigma(\mathcal{A}) = \text{fold} \begin{bmatrix} \mathbf{A}^{(2)} \\ \mathbf{A}^{(3)} \\ \vdots \\ \mathbf{A}^{(m_3)} \\ \mathbf{O} \end{bmatrix}.$$

Any tensor \mathcal{X} can be uniquely divided into $\mathcal{A} + \sigma(\mathcal{A})$.

We use $\bar{\mathcal{X}} \in \mathbb{R}^{m_1 \times m_2 \times m_3}$ to represent the DCT along each tube of \mathcal{X} , i.e., $\bar{\mathcal{X}} = \det(\mathcal{X}, [], 3) = \det(\mathcal{A} + \sigma(\mathcal{A}), [], 3)$. We define the block Toeplitz matrix of \mathcal{A} as

$$\mathsf{bt}(\mathcal{A}) := \begin{bmatrix} \mathbf{A}^{(1)} & \mathbf{A}^{(2)} & \cdots & \mathbf{A}^{(m_3-1)} & \mathbf{A}^{(m_3)} \\ \mathbf{A}^{(2)} & \mathbf{A}^{(1)} & \cdots & \mathbf{A}^{(m_3-2)} & \mathbf{A}^{(m_3-1)} \\ \vdots & \vdots & \ddots & \vdots \\ \mathbf{A}^{(m_3-1)} & \mathbf{A}^{(m_3-2)} & \cdots & \mathbf{A}^{(1)} & \mathbf{A}^{(2)} \\ \mathbf{A}^{(m_3)} & \mathbf{A}^{(m_3-1)} & \cdots & \mathbf{A}^{(2)} & \mathbf{A}^{(1)} \end{bmatrix}$$

The block Hankel matrix is defined as

$$bh(\mathcal{A}) := \begin{bmatrix} \mathbf{A}^{(2)} & \mathbf{A}^{(3)} & \cdots & \mathbf{A}^{(m_3)} & \mathbf{O} \\ \mathbf{A}^{(3)} & \mathbf{A}^{(4)} & \cdots & \mathbf{O} & \mathbf{A}^{(m_3)} \\ \vdots & \vdots & \ddots & \vdots \\ \mathbf{A}^{(m_3)} & \mathbf{O} & \cdots & \mathbf{A}^{(4)} & \mathbf{A}^{(3)} \\ \mathbf{O} & \mathbf{A}^{(m_3)} & \cdots & \mathbf{A}^{(3)} & \mathbf{A}^{(2)} \end{bmatrix}$$

The block Toeplitz-plus-Hankel matrix of $\mathcal A$ is defined as

 $btph(\mathcal{A}) := bt(\mathcal{A}) + bh(\mathcal{A}).$

The block Toeplitz-plus-Hankel matrix can be diagonalized. Theorem

 $bdiag(\bar{\mathcal{X}}) = (\mathbf{C}_{m_3} \otimes \mathbf{I}_{m_1})btph(\mathcal{A})(\mathbf{C}_{m_3}^T \otimes \mathbf{I}_{m_2}),$

where \otimes denotes the Kronecker product, C_{m_3} is an $m_3 \times m_3$ DCT matrix.

Definition: Given $\mathcal{X} \in \mathbb{C}^{m_1 \times m_2 \times m_3}$ and $\mathcal{Y} \in \mathbb{C}^{m_2 \times m_4 \times m_3}$, the t-product $\mathcal{X} * \mathcal{Y}$ is a third-order tensor of size $m_1 \times m_4 \times m_3$

$$\mathcal{Z} = \mathcal{X} * \mathcal{Y} := \mathsf{fold}(\mathsf{btph}(\mathcal{A})\mathsf{unfold}(\mathcal{Y})),$$

where $\mathcal{X} = \mathcal{A} + \sigma(\mathcal{A})$.

Theorem

Given a tensor $\mathcal{X} \in \mathbb{R}^{m_1 \times m_2 \times m_3}$, the DCT-based t-SVD of \mathcal{X} is given by

$$\mathcal{X} = \mathcal{U} *_{dct} \mathcal{S} *_{dct} \mathcal{V}^{H},$$

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

where $\mathcal{U} \in \mathbb{R}^{m_1 \times m_1 \times m_3}$, $\mathcal{V} \in \mathbb{R}^{m_2 \times m_2 \times m_3}$ are orthogonal tensors, $\mathcal{S} \in \mathbb{R}^{m_1 \times m_2 \times m_3}$ is a f-diagonal tensor, and \mathcal{V}^H is the tensor transpose of \mathcal{V} .

Table: The time cost of t-SVD and DCT-based t-SVD on the random tensors of different size.

Fourier-Transform based t-SVD

$$\mathcal{Z} = \mathcal{X} *_{fft} \mathcal{Y} = \mathsf{fold}(\mathsf{bcirc}(\mathcal{X})\mathsf{unfold}(\mathcal{Y}))$$

The DFT based t-SVD can be efficiently implemented via fast Fourier transform (fft).

Cosine-Transform based t-SVD

$$\mathcal{Z} = \mathcal{X} *_{dct} \mathcal{Y} = \mathsf{fold}(\mathsf{btph}(\mathcal{A})\mathsf{unfold}(\mathcal{Y}))$$

The DCT based t-SVD can be efficiently implemented via fast cosine transform (dct).

Fourier-Transform based t-SVD

$$\mathcal{Z} = \mathcal{X} *_{\mathit{fft}} \mathcal{Y} = \mathsf{fft}\left[\mathsf{fold}(\mathsf{blockdiag}(\hat{X}_{\mathit{fft}}) imes \mathsf{blockdiag}(\hat{Y}_{\mathit{fft}}))
ight]$$

The DFT based t-SVD can be efficiently implemented via fast Fourier transform (fft).

Cosine-Transform based t-SVD

$$\mathcal{Z} = \mathcal{X} *_{dct} \mathcal{Y} = \mathsf{dct} \left[\mathsf{fold}(\mathsf{blockdiag}(\hat{X}_{dct}) imes \mathsf{blockdiag}(\hat{Y})_{dct})
ight]$$

The DCT based t-SVD can be efficiently implemented via fast cosine transform (dct).

The first work is given by E. Kernfeld, M. Kilmer and S. Aeron, Tensor tensor products with invertible linear transforms, LAA, Vol 485, pp. 545-570 (2015).

We generalize tensor singular value decomposition by using other unitary transform matrices instead of discrete Fourier/cosine transform matrix.

The motivation is that a lower transformed tubal tensor rank may be obtained by using other unitary transform matrices than that by using discrete Fourier/cosine transform matrix, and therefore this would be more effective for robust tensor completion.

- Let $\mathbf{\Phi}$ be the unitary transform matrix with $\mathbf{\Phi}\mathbf{\Phi}^{H} = \mathbf{\Phi}^{H}\mathbf{\Phi} = \mathbf{I}$.
- $\hat{\mathcal{A}}_{\Phi}$ represents a third-order tensor obtained via multiplying by Φ on all tubes along the third dimension of \mathcal{A} .
- ► The **Φ**-product of $\mathcal{A} \in \mathbb{C}^{n_1 \times n_2 \times n_3}$ and $\mathcal{B} \in \mathbb{C}^{n_2 \times n_4 \times n_3}$ is a tensor $\mathcal{C} \in \mathbb{C}^{n_1 \times n_4 \times n_3}$, which is given by

$$\mathcal{C} = \mathcal{A} \diamond_{\mathbf{\Phi}} \mathcal{B} = \mathbf{\Phi}^{\mathcal{H}} \left[\mathsf{fold} \left(\mathsf{blockdiag}(\hat{\mathcal{A}}_{\mathbf{\Phi}}) \times \mathsf{blockdiag}(\hat{\mathcal{B}}_{\mathbf{\Phi}}) \right) \right],$$

where " \times " denotes the usual matrix product.

Theorem

Suppose that $A \in \mathbb{C}^{n_1 \times n_2 \times n_3}$. Then A can be factorized as follows:

$$\mathcal{A} = \mathcal{U} \diamond_{\mathbf{\Phi}} \mathcal{S} \diamond_{\mathbf{\Phi}} \mathcal{V}^{\mathcal{H}},$$

where $\mathcal{U} \in \mathbb{C}^{n_1 \times n_1 \times n_3}$, $\mathcal{V} \in \mathbb{C}^{n_2 \times n_2 \times n_3}$ are unitary tensors with respect to Φ -product, and $\mathcal{S} \in \mathbb{C}^{n_1 \times n_2 \times n_3}$ is a diagonal tensor.

Definition: The transformed tubal multi-rank of a tensor $\mathcal{A} \in \mathbb{C}^{n_1 \times n_2 \times n_3}$ is a vector $\mathbf{r} \in \mathbb{R}^{n_3}$ with its *i*-th entry as the rank of the *i*-th frontal slice of $\hat{\mathcal{A}}_{\Phi}$, i.e., $r_i = \operatorname{rank}(\hat{\mathcal{A}}_{\Phi}^{(i)})$. The transformed tubal tensor rank, denoted as $\operatorname{rank}_{tt}(\mathcal{A})$, is defined as the number of nonzero singular tubes of \mathcal{S} , where \mathcal{S} comes from the tt-SVD of $\mathcal{A} = \mathcal{U} \diamond_{\Phi} \mathcal{S} \diamond_{\Phi} \mathcal{V}^H$.

Definition: The transformed tubal nuclear norm of a tensor $\mathcal{A} \in \mathbb{C}^{n_1 \times n_2 \times n_3}$, denoted as $\|\mathcal{A}\|_{\mathsf{TTNN}}$, is the sum of the nuclear norms of all the frontal slices of $\widehat{\mathcal{A}}_{\Phi}$, i.e.,

$$\|\mathcal{A}\|_{\mathsf{TTNN}} = \sum_{i=1}^{n_3} \|\widehat{\mathcal{A}}_{\mathbf{\Phi}}^{(i)}\|_*.$$

Theorem

For any tensor $\mathcal{X} \in \mathbb{C}^{n_1 \times n_2 \times n_3}$, $\|\mathcal{X}\|_{\mathsf{TTNN}}$ is the convex envelope of the function $\sum_{i=1}^{n_3} \operatorname{rank}(\widehat{\mathcal{A}}_{\Phi}^{(i)})$ on the set $\{\mathcal{X} \mid \|\mathcal{X}\| \leq 1\}$.

$$\min_{\mathcal{L},\mathcal{E}} \|\mathcal{L}\|_{\mathsf{TTNN}} + \lambda \|\mathcal{E}\|_1, \ \text{ s.t.}, \ \mathcal{P}_{\Omega}(\mathcal{L} + \mathcal{E}) = \mathcal{P}_{\Omega}(\mathcal{X}),$$

where λ is a penalty parameter and \mathcal{P}_{Ω} is a linear projection such that the entries in the set Ω are given while the remaining entries are missing.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Assume that rank_{tt}(\mathcal{L}_0) = r and its skinny tt-SVD is $\mathcal{L}_0 = \mathcal{U} \diamond_{\Phi} S \diamond_{\Phi} \mathcal{V}^H$. \mathcal{L}_0 is said to satisfy the transformed tensor incoherence conditions with parameter $\mu > 0$ if

$$\max_{\substack{i=1,...,n_1}} \| \mathcal{U}^H \diamond_{\mathbf{\Phi}} \vec{\mathbf{e}}_i \|_F \le \sqrt{\frac{\mu r}{n_1}},$$
$$\max_{\substack{j=1,...,n_2}} \| \mathcal{V}^H \diamond_{\mathbf{\Phi}} \vec{\mathbf{e}}_j \|_F \le \sqrt{\frac{\mu r}{n_2}},$$

and

$$\|\mathcal{U}\diamond_{\Phi}\mathcal{V}^{H}\|_{\infty}\leq\sqrt{\frac{\mu r}{n_{1}n_{2}n_{3}}},$$

where \vec{e}_i and \vec{e}_j are the tensor basis with respect to Φ .

Theorem

Suppose that $\mathcal{L}_0 \in \mathbb{C}^{n_1 \times n_2 \times n_3}$ obeys transformed tensor incoherence conditions, and the observation set Ω is uniformly distributed among all sets of cardinality $m = \rho n_1 n_2 n_3$. Also suppose that each observed entry is independently corrupted with probability γ . Then, there exist universal constants $c_1, c_2 > 0$ such that with probability at least $1 - c_1(n_{(1)}n_3)^{-c_2}$, the recovery of \mathcal{L}_0 with $\lambda = 1/\sqrt{\rho n_{(1)}n_3}$ is exact, provided that

$$r \leq rac{c_r n_{(2)}}{\mu(\log(n_{(1)}n_3))^2}$$
 and $\gamma \leq c_\gamma$,

where c_r and c_γ are two positive constants.

Data-Dependent Transform

Theorem

Let A be a given tensor with size $n_1 \times n_2 \times n_3$ and \mathbf{A} be its unfolding matrix along the third-dimension. Suppose rank $(\mathbf{A}) = k$. Then a global optimal solution of the following problem

$$\min_{\substack{\text{rank}(\mathbf{B})=k,\mathbf{\Phi}}} \|\mathbf{\Phi}\mathbf{A} - \mathbf{B}\|_{F}^{2}$$

s.t. $\mathbf{\Phi}^{H}\mathbf{\Phi} = \mathbf{\Phi}\mathbf{\Phi}^{H} = \mathbf{I},$

is given by $\mathbf{\Phi} = \mathbf{U}^H$ and $\mathbf{B} = \mathbf{\Sigma} \mathbf{V}^H$.

The original multi-view data with *n* objects from *m* views is taken as a tensor. More specifically, each object from different views is twisted into a third-order tensor $D \times 1 \times m$ (*D* is the total number of features in all the views), then the whole data set can be organized as a tensor $\mathbb{R}^{D \times 1 \times m}$

Then the multi-view data can be represented by collecting all objects tensors along the second mode to obtain a tensor $\mathcal{X} \in \mathbb{R}^{D \times n \times m}$.

Fig. 1. Demonstration of the multi-view representation learning (MRL). Given an object i with multiple views (a), MRL takes advantage of the multi-view information (b) to learn the new representation of the object (c).

Fig. 2. The framework of tensor-based representation learning for multi-view clustering (**tRLMvC**). X is the multi-view data tensor, Z is the self-expressive tensor, $\{U, V, W\}$ is obtained by Tucker decomposition on Z. Among them, $W \in \mathbb{R}^{n \times k_1}$ shows the contributions of different views, $U \in \mathbb{R}^{n \times k_1}$ and $V \in \mathbb{R}^{n \times k_2}$ indicate the representation of multi-view data in latent space from two aspects, and H = |UV| is the final low-dimensional representation.

Latent space with size k_1 and k_2 respectively, which can essentially capture the object cluster structure. $W \in \mathbb{R}^{m \times 1}$ is a column vector recording the contributions of different views.
