# SAT problems

Propositional logic, CNF

literals:  $x_1, x_2, \dots, x_n$

clauses:  $(x_1 \vee x_2 \vee x_5) \quad (\neg x_2 \vee x_3 \vee \neg x_7) \quad \dots$

problem: find an assignment to literals so that the conjunction of the clauses is true, or prove unsatisfiable

$$(x_1 \vee x_2 \vee x_5) \wedge (\neg x_2 \vee x_3 \vee \neg x_7) \wedge \dots$$

2SAT: every clause has at most 2 literals

**P-solvable**

3SAT: every clause has at most 3 literals

**NP-hard**

# SAT solvers

SAT problems have many important applications

many SAT solvers are ready for use

DPLL

WalkSAT

# DPLL

## Davis–Putnam–Logemann–Loveland algorithm

**function** DPLL-SATISFIABLE?(*s*) **returns** *true* or *false*

**inputs:** *s*, a sentence in propositional logic

*clauses*  $\leftarrow$  the set of clauses in the CNF representation of *s*

*symbols*  $\leftarrow$  a list of the proposition symbols in *s*

**return** DPLL(*clauses*, *symbols*, { })

---

**function** DPLL(*clauses*, *symbols*, *model*) **returns** *true* or *false*

**if** every clause in *clauses* is true in *model* **then return** *true*

**if** some clause in *clauses* is false in *model* **then return** *false*

*P*, *value*  $\leftarrow$  FIND-PURE-SYMBOL(*symbols*, *clauses*, *model*)

**if** *P* is non-null **then return** DPLL(*clauses*, *symbols* – *P*, *model*  $\cup$  { *P*=*value* })

*P*, *value*  $\leftarrow$  FIND-UNIT-CLAUSE(*clauses*, *model*)

**if** *P* is non-null **then return** DPLL(*clauses*, *symbols* – *P*, *model*  $\cup$  { *P*=*value* })

*P*  $\leftarrow$  FIRST(*symbols*); *rest*  $\leftarrow$  REST(*symbols*)

**return** DPLL(*clauses*, *rest*, *model*  $\cup$  { *P*=*true* }) **or**

DPLL(*clauses*, *rest*, *model*  $\cup$  { *P*=*false* })

a deep-first search with heuristics

# DPLL heuristics

*Pure symbol heuristic:* A **pure symbol** is a symbol that always appears with the same “sign” in all clauses.

$$(A \vee \neg B) \wedge (\neg B \vee \neg C) \wedge (C \vee A)$$

$A$  and  $B$  is pure, but not  $C$

*Unit clause heuristic:* A **unit clause** is a clause with just one literal.

$$(A \vee \neg B) \text{ with } A = \text{true}$$

is a unit clause

# Other tricks

Component analysis : find disjoint subsets

Variable and value ordering : assign most frequent variable at first

Intelligent backtracking : remember conflicts

Random restart

Clever indexing

# WalkSAT

a local search hill-climbing or others.

```
function WALKSAT(clauses, p, max_flips) returns a satisfying model or failure  
inputs: clauses, a set of clauses in propositional logic  
         p, the probability of choosing to do a “random walk” move, typically around 0.5  
         max_flips, number of flips allowed before giving up  
  
model ← a random assignment of true/false to the symbols in clauses  
for i = 1 to max_flips do  
    if model satisfies clauses then return model  
    clause ← a randomly selected clause from clauses that is false in model  
    with probability p flip the value in model of a randomly selected symbol from clause  
    else flip whichever symbol in clause maximizes the number of satisfied clauses  
return failure
```

failure ≠ unsatisfiable

# The landscape of random SAT problems

Not all SAT instances are hard

under-constraint: a few clauses => easy to enumerate

over-constraint: too many clauses => unsatisfiable

**Figure 7.19** (a) Graph showing the probability that a random 3-CNF sentence with  $n = 50$  symbols is satisfiable, as a function of the clause/symbol ratio  $m/n$ . (b) Graph of the median run time (measured in number of recursive calls to DPLL, a good proxy) on random 3-CNF sentences. The most difficult problems have a clause/symbol ratio of about 4.3.

state  $s$

Action( $s$ )

Result( $s, a$ )

*Action(Fly( $p, from, to$ ),*

*PRECOND: At( $p, from$ )  $\wedge$  Plane( $p$ )  $\wedge$  Airport( $from$ )  $\wedge$  Airport( $to$ )*

*EFFECT:  $\neg$ At( $p, from$ )  $\wedge$  At( $p, to$ )*

*Action(Fly( $P_1, SFO, JFK$ ),*

*PRECOND: At( $P_1, SFO$ )  $\wedge$  Plane( $P_1$ )  $\wedge$  Airport( $SFO$ )  $\wedge$  Airport( $JFK$ )*

*EFFECT:  $\neg$ At( $P_1, SFO$ )  $\wedge$  At( $P_1, JFK$ )*

# Precondition

action **a** is **applicable** in state **s** if the preconditions are satisfied by **s**

$$(a \in \text{ACTIONS}(s)) \Leftrightarrow s \models \text{PRECOND}(a)$$

$$\forall p, from, to \ (Fly(p, from, to) \in \text{ACTIONS}(s)) \Leftrightarrow \\ s \models (At(p, from) \wedge Plane(p) \wedge Airport(from) \wedge Airport(to))$$

# Result

removing the fluents that appear as negative literals in the action's effects (what we call the **delete list** or  $\text{DEL}(\mathbf{a})$ ), and adding the fluents that are positive literals in the action's effects (what we call the **add list** or  $\text{ADD}(\mathbf{a})$ )

$$\text{RESULT}(s, a) = (s - \text{DEL}(a)) \cup \text{ADD}(a) .$$

*Action*(*Fly*( $P_1$ , *SFO*, *JFK*),

**PRECOND:**  $At(P_1, SFO) \wedge Plane(P_1) \wedge Airport(SFO) \wedge Airport(JFK)$

**EFFECT:**  $\neg At(P_1, SFO) \wedge At(P_1, JFK)$

# Example

$Init(On(A, Table) \wedge On(B, Table) \wedge On(C, A)$   
 $\wedge Block(A) \wedge Block(B) \wedge Block(C) \wedge Clear(B) \wedge Clear(C))$   
 $Goal(On(A, B) \wedge On(B, C))$   
 $Action(Move(b, x, y),$   
PRECOND:  $On(b, x) \wedge Clear(b) \wedge Clear(y) \wedge Block(b) \wedge Block(y) \wedge$   
 $(b \neq x) \wedge (b \neq y) \wedge (x \neq y),$   
EFFECT:  $On(b, y) \wedge Clear(x) \wedge \neg On(b, x) \wedge \neg Clear(y))$   
 $Action(MoveToTable(b, x),$   
PRECOND:  $On(b, x) \wedge Clear(b) \wedge Block(b) \wedge (b \neq x),$   
EFFECT:  $On(b, Table) \wedge Clear(x) \wedge \neg On(b, x))$

**Figure 10.3** A planning problem in the blocks world: building a three-block tower. One solution is the sequence  $[MoveToTable(C, A), Move(B, Table, C), Move(A, Table, B)]$ .

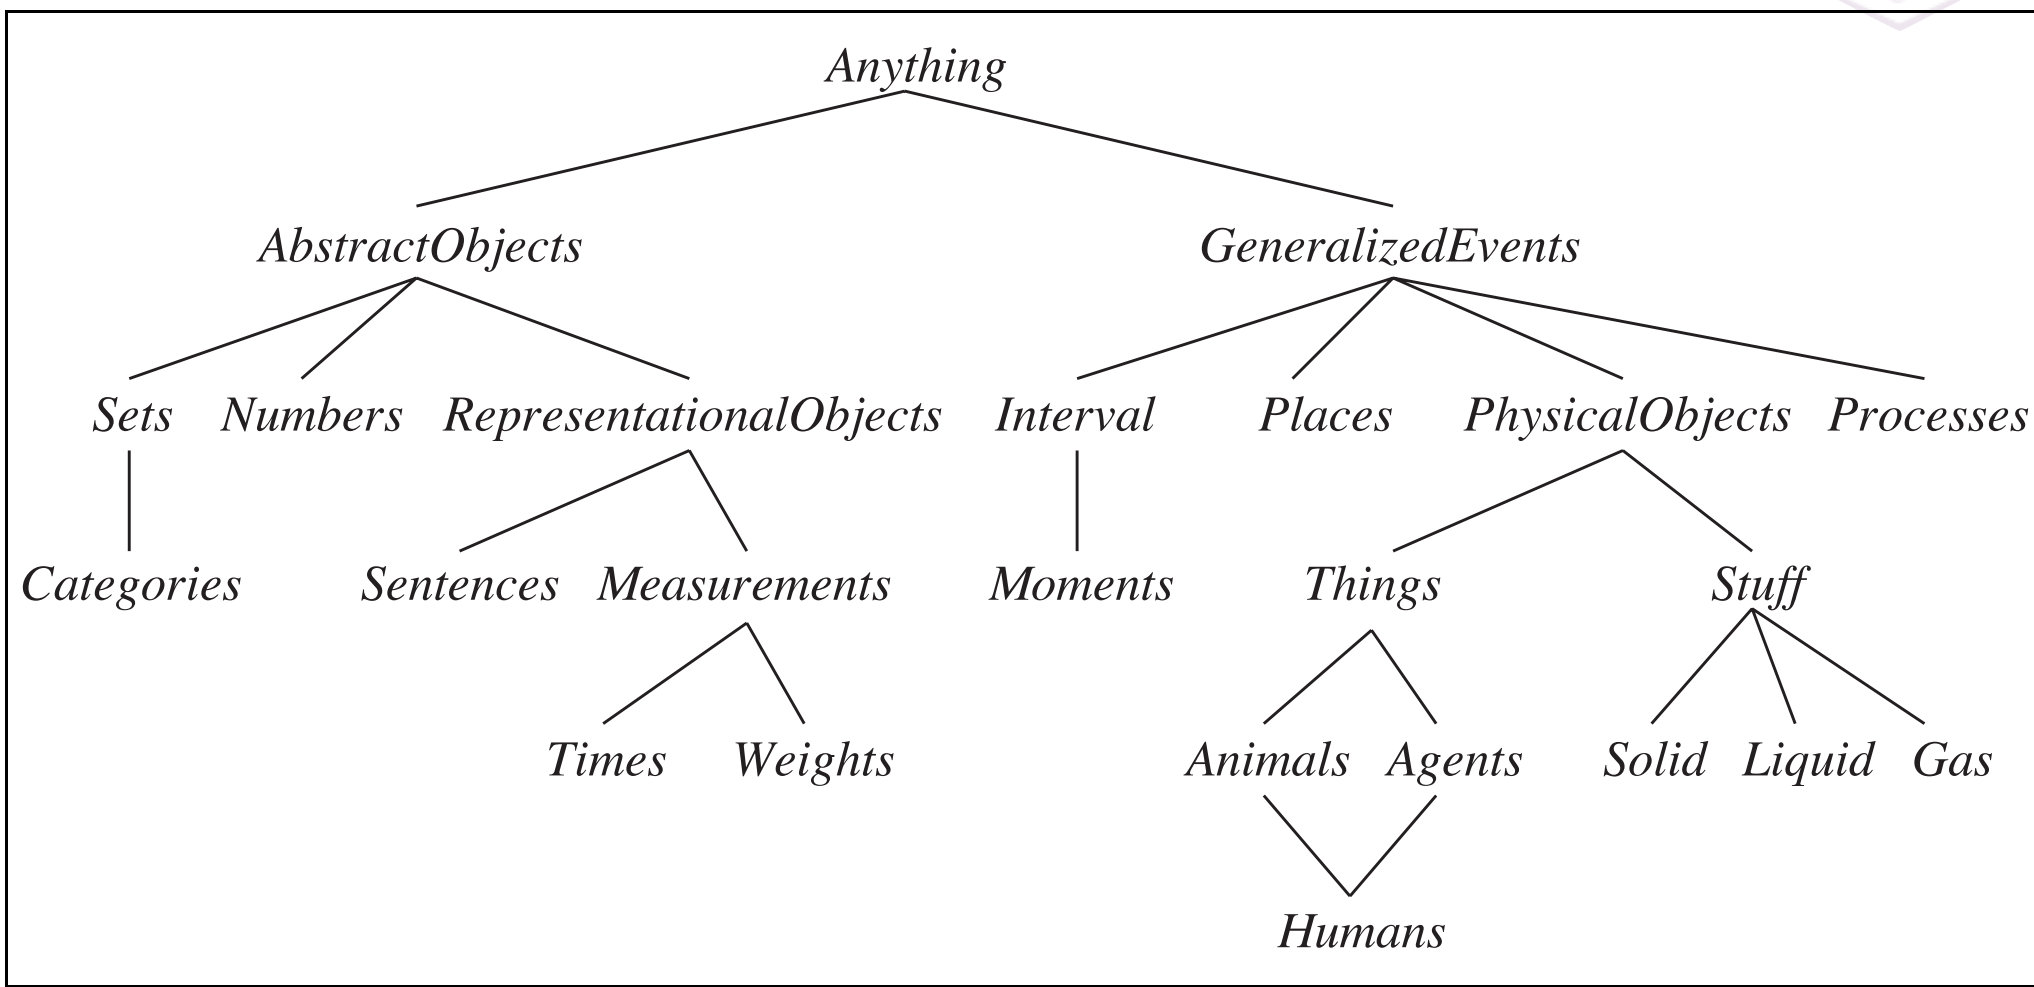

**Figure 10.4** Diagram of the blocks-world problem in Figure 10.3.
